

Vessel Manager

Vessel Manager, combined with Fledermaus and the Vessel Operations Class, allows real-time visualization of a moving vessel in a 3D scene. The vessel may be a ship, ROV, AUV, oil platform, or any other type of vehicle. Vessel navigation data can be read through the serial port, or played back from a pre-recorded file.

Screenshot of Vessel Manager in real-time operations with an ROV.

Vessel Manager is the interface between the navigation data and Fledermaus, visualized in a full 3D environment. The combination of the two provide the user with the ability to plan the movement of vessels in restricted waterways, forecast dredging requirements, and manage the movement of the vessel in real time. With our Dynamic Range Finder, bearing, distance and angle measurements can be quickly and easily obtained.
